Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

S11119
Ig kappa chain V region (clone NQ6-8.3.1) - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Date: 19-Mar-1997 #sequence_revision 23-Aug-1997 #text_chang
C;Accession: S11119
R;Kaartinen, M.; Griffiths, G.M.; Markham, A.F.; Milstein, C.
Nature 304, 320-324, 1983
A;Title: mRNA sequences define an unusually restricted IgG res

```
a polypeptide motif containing a sufficient number of contiguous amino acid residues from a polypeptide associated with a disease of protein pelypeptide or to a disease-associate conformer of the polypeptide; and polypeptide or to a disease-associate conformer of the polypeptide; and polypeptide from which the motif is derived, where the resulting hybrid polypeptide binds with greater affinity to a disease causing or infectious conformer of the polypeptide that is the resulting hybrid polypeptide motif compared to a benign form of the polypeptide. Also escribed: (1) a mucleic acid molecule, (3) a cell comprising the vector; (4) detecting an isoform or a PrPSc form of a prion polypeptide or a comprising an isoform or a PrPSc form of a prion polypeptide or a propertied sassociated with a disease of protein aggregation, in a sample; (5) a solid support comprising a plurality of polypeptides described above; (6) detecting cells that contain a protein conformer associated with a disease of protein aggregation, (7) preparing a hybrid molecule that specifically interacts with one conformer of a protein involved in the disease mentioned above; and (8) an anti-idiotype antibody that specifically binds to an infectious form of a protein involved in the disease mentioned above; and (8) an anti-idiotype antibody that specifically binds to an infectious form of a protein conformer of a protein. (1) has neuroprotective, antiparkinsonian, cytostatic, nephrotropic, cardiant, cerebroprotective, antiparkinsonian, cytostatic, nephrotropic, cardiant, antiparkinsonian, cytostatic, nephrotropic, antiparkinsonian, conformation, such as Creutzfelde-Jakob disease, scrapic and bovine spongilorm encephalopsthy, Alzheimer's disease, reactive amyloidosis, reactive amyloidosis, reactive amyloidosis, sesociated with chronic inflammatory disease, perceptions and perception of perception and methods a disease, perception and methods of the present invertion and methods a disease, perception of a disease, immunoglobulish amyloidosis, reactive a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        myeloma, plasma

The present invention describes cell death-inducing agents containing the degradation product of an antibody which can recognise human leukocyte antigen (HLA). Also described: (1) a degradation product of the 2D7 antibody; (2) a similar degradation product of an antibody which is: (a) cone containing an amino acid sequence of (SEQ ID NO:6) but with some amino acids substituted, deleted, inserted and/or added and being functionally equivalent to the parent; (c) one containing the CDR amino-acid sequences of (SEQ ID NO:2) and (SEQ ID NO:4) with 18 and 144 amino-acids sequences of (SEQ ID NO:4) but with some amino acids substituted, deleted, inserted and/or added and being functionally equivalent to the parent; (3) a process for producing an antibody with an increase of activity by degrading a HLA-recognising antibody, or by degrading 2D7 antibody; (4) cell death-inducing agents containing the degradation products of antibody, comprising the produced antibodies or 2D7 antibody as active ingredient; (5) agents for inhibiting cell proliferation containing the degradation products of antibody, comprising the produced antibodies or 2D7 antibody; and (7) remedies for autoimmune diseases containing the degradation products of antibody, comprising the produced antibodies or 2D7 antibody; and (7) remedies for autoimmune diseases containing the degradation products of antibody, comprising the produced antibodies or 2D7 antibody; and (7) remedies for autoimmune diseases for treating e-grentci immunosuppressive, antiinflammatory and dermatological activities. The cell death-inducing agents are applicable in antitumour agents and streams and systemic lupus erythematosus. The present sequence containing which is and systemic lupus erythematosus.                                                                                                                                                                                                                                                                                                                                                  The MAb recognises the epitope on alpha/beta TCR and includes a mediator resonse. It is highly effective in clinical application before, after and during bone marrow transplant surgery, in treatment of cancer and autoimmune diseases, and has applications in immunoregulation. Abs may also be used in detection of immunocompetent T-cells. (Updated on 25-MAR-2003 to correct PA field.)

The present sequence is that of the light chain variable region of claimed anti-human RANK ligand (RANK-L) murine monoclonal antibody (mAb) 19H22 (isotype IgG2b/Kappa). The mAb is produced by hybridoma cells obtained by immunising CB6 fl mice with human RANK-L protein, and fusing obtained by munising CB6 fl mice with human RANK-L protein, and fusing speen cells with X63-Ag8.653 myeloma cells. 19H22 mAb is specific for human RANK-L, having a binding affinity characterised by a dissociation constant of about 10 power -10 M. RANK-L is a member of the tumour necrosis factor family of proteins and a key regulator of the immune system, bone development and homeostasis. Including Fab or F(ab/)2 chimeric and humanised 19H22 antibodies, including Fab or F(ab/)2 fragments, antibodies comprising the light and heavy chain variable regions of 19H22, and antibodies comprising the complementarity determining regions of 19H22. These are used in methods for the determining regions of 19H22. These are used in methods for the including psoriasis, insulin dependent diabetes, inflammatory bowel including psoriasis, insulin dependent diabetes, inflammatory bowel recombinant production of the antibodies, using isolated nucleic acids and transfected host (preferably mammalian) host cells, and a method of diagnosing conditions associated with Th1 T-cell activity or osteoclast development and activation, in particular those listed above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ·

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence is the light chain variable region of the antibody of the invention. The antibody is an anti-CEA (carcinoembryonic antigen) antibody (806.077 Ab). Host cells or transgenic organisms transformed with DNA encoding the antibody, are used to make the antibody or conjugate. The conjugate is used in a medicament suitable for intravenous administration. The conjugate can be used for cancer therapy, selectively killing tumour cells. The antibody can be used for in vivo or in vitro diagnosis of cancer. (Updated on 17-OCT-2003 to standardise OS field)

The VK sequence is one of 23 (AAR21286-308) expressed from a single chain from the VK sequence is one of 23 (AAR21286-308) expressed from a single chain from the Ibrary produces a diverse repertoire of antibody completed from mRNA from mice immunised with phox coupled to chicked serum albumin. The VH and VL kappa sequences were separately amplified by CR (AAQ23474-84) and ligated into fdCAT2 (AAQ23463) for expression on FC (AAQ23474-84) and ligated into fdCAT2 (AAQ23463) for expression on the phage surface as fusions with gene III. The resulting library of clones was diverse; 23 hapten binding clones were sequenced revealing 8 vH genes (A-H; AAR21286-92). Most clones were VH-B combinations so a further interachical library was prept. W crossing vH-B with the VK repertoire. The resulting library was screened for hapten binding and 24 clones sequenced. 14 new partners (AAR21293-308) for VH-B were identified. Nearly all the VK genes were "No.11ke"; only f, (from the original library) and h, p, q, and r (from the hierarchical library) were visinal library) and h, p, q, and r (from the hierarchical library) were visinal library) and h, p, q, and r (from the hierarchical library) were visinal library and h, p, q, and r (from the hierarchical library) and h, p, q, and r (from the hierarchical library) were visinal library) and h, p, q, and r (from the hierarchical library) and h, p, q, and r (from the hierarchical library) and h, p, q, and r (from the hierarchical library) and h, p, q, and r (from the hierarchical library) and h, p, q, and r (from the hierarchical library) and h, p, q, and r (from the hierarchical library) and h, p, q, and r (from the hierarchical library) and h, p, q, and r (from the hierarchical library) and h, p, q, and r (from the hierarchical library) and h, p, q, and r (from the hierarchical library) and h, p, q, and r (from the hierarchical library) and h, p, q, and r (from the hierarchical library) and h, p, q, and r (from the hierarchical library) and h, p, q, and r (from the hierarchical lib
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Griffiths AD;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes antibodies or polypeptides for michlipase, which enhance the hydrolytic activity of the enzyme. The polypeptides, antibodies or immunocomplex are useful for biocathes bioconversion reactions (e.g. hydrolysis, interesterification, esterification, alcoholysis, acidolysis or aminolysis); in bion technology; in bioremediation; in preparing fragrances or flavorhemical modification of alcohols, acids, esters or fats; in contemical and food industries; in preparing detergents; or identifying, purifying or measuring microbial lipases. The pressence represents the variable light chain of monoclonal antised is directed against the Candida rugosa lipase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .

The polypeptide comprises a first polypeptide comprising the antigen binding portion of of the light chain variable region of an antibody and a second polypeptide comprising the antigen binding portion of the heavy chain variable region of an antibody and at least one peptide linker linking the first and second polypeptide chains. The resulting single chain polypeptide can be used in diagnostics, therapy (in vivo and in vitro), imaging, purifications and biosensors. (Updated on 25-MAR-2003 to correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61

                                                                                                                                                                                                                                                                                                                                                                                                                                               The mature heavy chain (AAR99643) and mature light chain (AAR99644) of the mouse anti-bovine growth hormone monoclonal antibody 3C2 can be utilised in novel single chain binding molecules (AAR99645-48), in which the hypervariable regions from IgG1 3C2 MAb are joined by peptide linkers derived from the Fv regions of an IgA class anti- phosphorylcholine myeloma antibody, MCPC-603. The single chain molecules retain the binding specificity of the light and heavy chains and have the advantages of smaller size, greater stability and reduced cost. They can be used in therapy, diagnostics, imaging, purification and biosensors. (Updated on 25-MAR-2003 to correct PF field.)

Portions of the heavy chain (AAR97376) and light chain (AAR97377) of murine Igg1 anti-bovine growth hormone monoclonal antibody 3C2 can be incorporated into novel single polypeptide chain binding molecules (see also AAW02188-90). These are expressed in host cells using DNA constructs (see also AAT36460-62) that include heavy and light chain encoding sequences (AAT29056 and AAT29057) joined by linker moleties. Following expression and refolding, the single chain binding molecules show the binding characteristics of the aggregate of the 2 original heavy and light chains of the variable region of the antibody. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               pilus;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 vn genes (A-H; AAR21264-71) in a variety of pairings with 7 Vk gene; AAR21286-92). Most clones were VH-B combinations so a further hierarchical library was prepd. by "crossing" VH-B with the Vk gene clones sequenced. 14 new partners (AAR21293-308) for VH-B were the clones sequenced. 14 new partners (AAR21293-308) for VH-B were clones sequenced. 14 new partners (AAR21293-308) for VH-B were clones, 15 very and h, p, q, and r (from the hierarchical library) and h, p, q, and r (from the hierarchical library) very coriginal library) and h, p, q, and r (from the hierarchical library) to Vkox1 type genes. Of the 24 hierarchical clones, 4 were of type "h". C kd of VH-B/Vk-d for phOx-GABA was 10 nM, one of the highest values for this suggests that phage bearing scfv fragments having weak affinition and be selected with antigen, probably due to the avidity of the multipody heads on the phage. The different combinations could alone heads.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ld also

The OK3T light chain sequence was deduced from the cDNA sequence isolated from a library prepared from OK3T producing cells. The library was screened with a probe complementary to a region in the mouse kappa constant region. The OK3T sequence was used in CDR- grafting experiments to prepare humanised antibodies. NOTE: Data found in patent WO9109968 has been used to index this entry. (Updated on 25-MAR-2003 to correct PA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AA
                                                                                                                                                                                                                                                                                              Increasing the content of transgene-coded biomolecules in animal, useful for producing proteins for diagnosing, prevetreating viral diseases and cancer, comprises changing the of ATP and/or ADP.
                                                                                                                                                                                                                                                                                                                                                                          The invention relates to increasing the content of one or coded biomolecules in an organism and involves changing the of ATP and/or ADP in cells of the organism. The yield of twolecules in host cells is often insufficient for industrium the method increases the yield of transgenic molecules in plant host cells, therefore facilitating their production industrial scale. The proteins produced by the method are diagnosing, preventing and/or treating viral diseases and present sequence represents a single-chain (scFv) antibody exemplify the increase in the expression of scFv antibodie
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              coli expression plasmid pUBS520.ScFvOx encoded protein

This invention describes a novel preparation of a water-soluble, naturally occurring eukaryotic polypeptide containing two or more cysteine units bound via a disulfide bridge which comprises cultivation of prokaryotic cells in the presence of arginine or an amide compound. The method is useful for the preparation of eukaryotic proteins e.g. proteases, interferons, protein hormones, antibodies or antibody fragments (e.g. a single chain FV fragment that binds to thyroid stimulating hormone). It is especially useful for preparing proteins with more than five disulfide bridges, e.g. recombinant plasminogen activator (rPA). The technique is simple and does not require in vitro after-treatment, such as the removal of inclusion bodies, reduction or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DIELTOSPAIMSASPGEKVIMTCSASSVNYMHWFQQESGTFPKRIYDTSKLASGVPAR

Producing naturally folded eukaryotic proteins e.g. antibodies, interferon, hormones or proteases that contain two or several cysteines linked by disulfide bridges comprises co-expression of a molecular chaperone.

Disclosure; Page 19; 35pp; English.

The present invention relates to a method for production of a naturally folded eukaryotic protein containing two or more cysteines linked by disulfide bridges. The method comprises co-expression and secretion into the periplasm of a molecular chaperone via an expression vector coding for the chaperone. The expression vector also encodes a signal sequence. The method is useful for producing a naturally folded eukaryotic protein such as an antibody, antibody fragment, interferon, protein hormone or a protease containing two or several cysteines linked by disulfide bridges. The present sequence is a fusion protein composed of the PelB signal sequence and ScFvOxazolon. This sequence was used in the method of the present invention

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT 1
S52446
Ig heavy chain V region precursor - mouse
C; Species: Mus musculus (house mouse)
C; Date: 08-May-1995 #sequence_revision 03-Aug-1995 #text_change 23-C; Accession: S52446
R; Berdaz, J; Kraehenbuhl, J.P.
Submitted to the EMBL Data Library, November 1994
A; Description: Specific amplification by the polymerase chain react A; Reference number: S52445
A; Accession: S52446
A; Molecule type: DNA
A; Cross-references: EMBL: X82692; NID: 9673441; PIDN: CAA58013.1; PID: C; Genetics:
A; Introns: 16/1
C; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin
F; 34-116/Domain: immunoglobulin homology <IMM>
                                                                                                                                                                                                                                                                                                                                                                                       1;

2-phenyloxazolon t O response RESULT 2
S11100
Ig heavy chain V region (clone NQ2-20.5.3) - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Date: 19-Mar-1997 #sequence_revision 23-Aug-1997 #text_change 21-C;Accession: S11100
R;Kaartinen, M.; Griffiths, G.M.; Markham, A.F.; Milstein, C.
Nature 304, 320-324, 1983
A;Title: mRNA sequences define an unusually restricted IgG response A;Reference number: S07331; MUID:83271467; PMID:6877353
A;Accession: S11100
A;Molecule type: mRNA
A;Residues: 1-112 <NAT>
C;Superfamily: immunoglobulin V region; immunoglobulin homology
